ENERGY POLICY

LOGSTOR is a leading manufacturer of products to the energy sector on a global basis. As an active partner and player together with many other companies, it is important that LOGSTOR, also in internal matters regarding energy, serve as a strong and good example to all stakeholders. This is the reason why LOGSTOR wish to have an active focus on implementation of Energy saving initiatives and subsequently maintaining the new lower level of energy consumption. The schedule will cover all activities of LOGSTOR, as well as securing compliance with EU, local law and other regulations.

We all play important role in reducing relative energy consumption, and in developing energy society that counter-fights with CO₂ emmision and has as little as possible negative impact on our environment.

The energy policy is complied by:

ENERGY	<ul style="list-style-type: none"> • bringing energy consumption in focus both during the daily operation of the production facilities and by any restoration of the facilities; • informing our suppliers that energy is an important part of the investment analysis when purchasing any new equipment, machinery or the like, which has significant impact upon the energy consumption, with energy efficiency as an selection criterion; • energy consumption monitoring on a regular basis, to ensure continous improvement in consumption reduction; • complying with all requirements whether by law or agreements with public authorities, as well as other requirements related to energy use, consumption and efficiency; • defining goals with associated action plans to constantly improve energy effectiveness and energy efficiency, as well as ensuring compliance with the goals and action plans; • making the energy consumption visible to every employee, and in cooperation with the employees, identifying their opportunities to improve the energy consumption without compromising the production of products with high energy efficiency; • positively motivating the employees to bring up their ideas and suggestions to reduce the energy consumption of LOGSTOR; • ensuring that the necessary resources and information are available at any time; • supporting design-related activities that take into account the improvement of energy performance; • continuous improvement of the energy management system and energy performance.
